**Massive runaways:
constraints on
binary interactions
explosion physics
and field
contamination**

Collaborators: S. E. de Mink, E. Zapartas, Y. Götberg,
F. R. N. Schneider, R. G. Izzard, H. Sana

Why Massive Runaways?

Why Massive Runaways?

~ 70% of O type stars are in close binaries

(e.g. Mason *et al.* '09, Sana & Evans '11, Sana *et al.* '12, Kiminki & Kobulnicky '12, Kobulnicky *et al.* '14)

~ 10% of O type stars are runaways!

(e.g. Blaauw '61, Gies '87, Stone '91)

⇐ Bow shocks

Doppler shifts

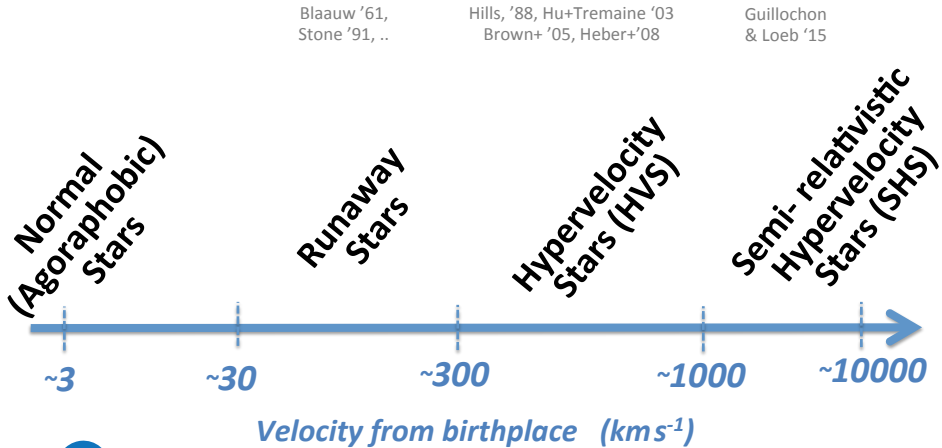

Proper motions

(if distance known)

How fast?

(courtesy of S. E. de Mink)

Why so fast?

(courtesy of S. E. de Mink)

Introduction

Binary SN Scenario

What can we learn?

- SN kicks
- Binary physics
- Field contamination

Methods

- Binary Population Synthesis

Overview Preliminary Results

- Do they come from a binary?
 - How fast can they be?
- Fraction of field stars from a binary?

Conclusions

- Unbinding Matter

(e.g. Blaauw '61)

- Ejecta Impact

(e.g. Tauris & Taken '98)

- SN Natal Kick

(e.g. Cordes *et al.* '93)

Introduction

Binary SN Scenario

What can we learn?

- SN kicks
- Binary physics
- Field contamination

Methods

- Binary Population Synthesis

Overview Preliminary Results

- Do they come from a binary?
 - How fast can they be?
- Fraction of field stars from a binary?

Conclusions

ν emission and/or ejecta anisotropies

Question: do BH receive a kick?

Mösta et al. 2014

ν emission and/or ejecta anisotropies

Runaways

Gravitational Waves

XBs 9/22

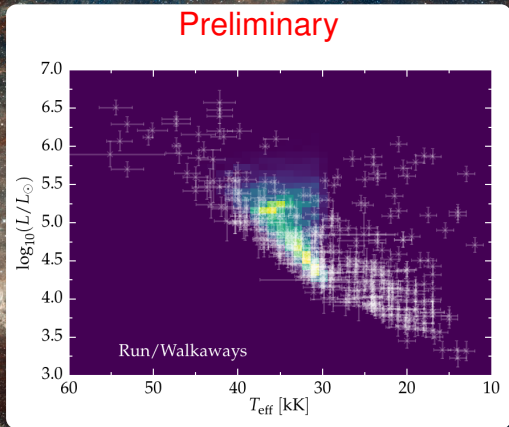

Field contamination

ANTON PANNEKOEK

- SN kicks
- Binary physics
- Field contamination

Methods

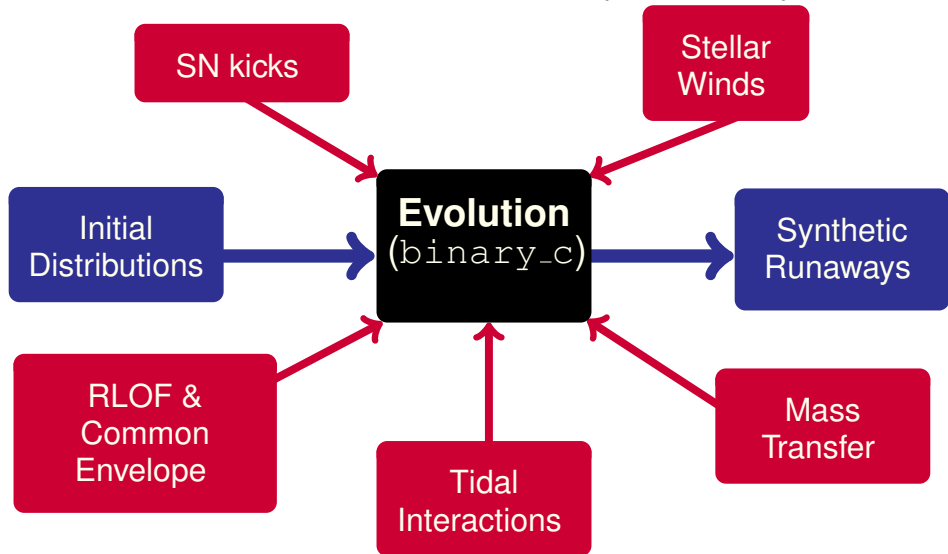

- Binary Population Synthesis

Overview Preliminary Results

- Do they come from a binary?
 - How fast can they be?
- Fraction of field stars from a binary?

Conclusions

Runaways from binary disruption are accretors

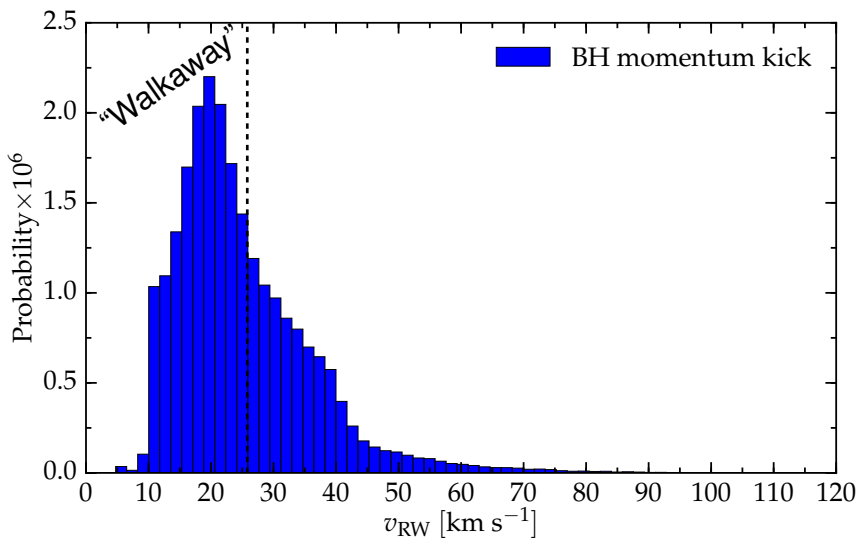

~ Rotational velocity

~ Line of sight velocity

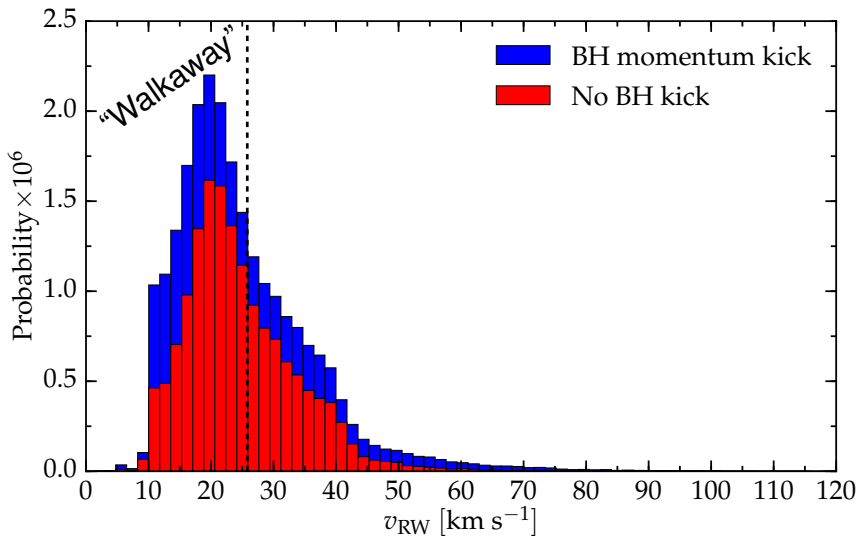

O-type from disrupted binaries only

O-type from disrupted binaries only

O-type from disrupted binaries only

Preliminary: How far can they go?

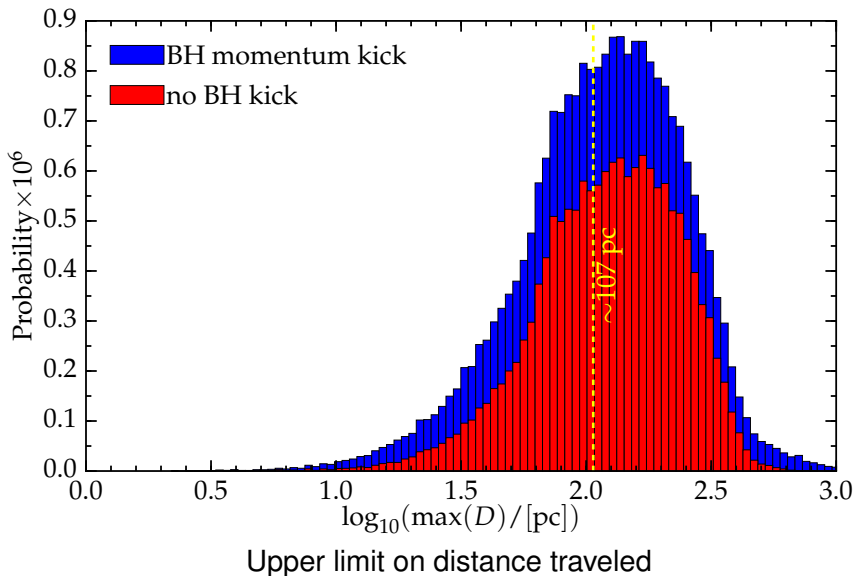

Upper limit on distance traveled

$$\max(D) \stackrel{\text{def}}{=} v_{\text{RW}} \times \Delta t_{\text{RW}} \Rightarrow \text{No potential well}$$

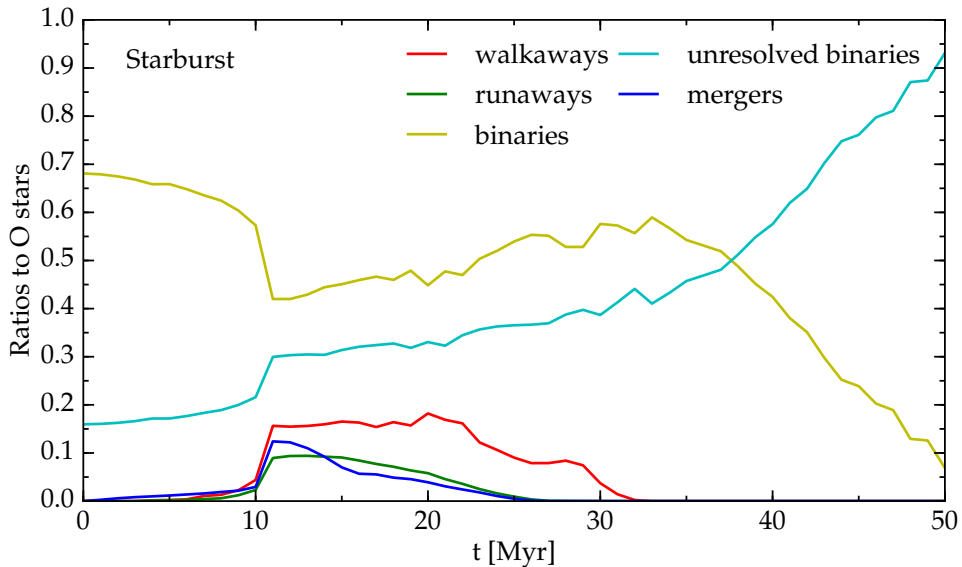

$$1 \text{ km s}^{-1} \simeq 1 \text{ pc Myr}^{-1}$$

Preliminary: How far can they go?

$$\max(D) \stackrel{\text{def}}{=} v_{\text{RW}} \times \Delta t_{\text{RW}} \Rightarrow \text{No potential well}$$

$$1 \text{ km s}^{-1} \simeq 1 \text{ pc Myr}^{-1}$$

 - How fast can they be?
- Fraction of field stars from a binary?

Conclusions

Robustness checks:

- Binary physics assumptions;
- Initial distributions;
- **Star Formation History**;
- Different BH-kick models.

Take home points

Massive walk/runaways stars...

- **...carry info on previous binary evolution;**
- **...can be used to learn about companion explosion;**
- **...enhances role of massive stars in galaxies.**

Robustness checks:

Soon HST will provide proper motion of these stars!

Observed Runaways form 3 groups on the (v_r , $v_{\text{eq}} \sin i$) plane

- 23 (mostly) single O-type RWs
- Fast rotators are slow
- Fast RWs are slow rotators

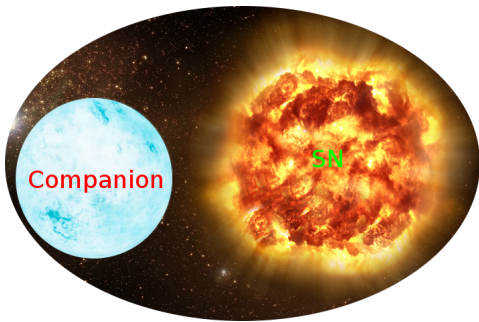

Credits: H. Sana *et al.* (in prep.)

SN in a Binary

Blaauw, 1961

Dynamical Ejection

Poveda *et al.*, 1967

$$v_r \simeq v_2^{\text{orb}}$$

...but binaries are still important!

- (Binding) Energy reservoir
- Cross section $\propto a^2 \gg R_*^2$
- $\sim 100\%$ O stars are in binaries

Explosion asymmetries \Rightarrow extra kick (?)
